Lab 2: Data Visualization and Descriptive analytics - Practice Questions

Date: 13-01-2026

1. Display the five-number summary (Minimum, First Quartile (Q1), Median (Q2), Third Quartile (Q3), and Maximum) for all numerical attributes in the dataset.
2. Compute the first quartile (Q1) for all numerical attributes in the dataset.
3. Plot line graphs for the numerical attributes in the dataset using Matplotlib and Seaborn.
4. Using Seaborn and Matplotlib, histogram–KDE distribution plots were generated for the features
5. Using Seaborn and Matplotlib, histogram–KDE distribution plots were generated for the features `Unit_Price`, `Revenue`, and `Profit`, with the mean, median, and control limits $\mu \pm 2.7\sigma$ marked. What is the distribution shape of each feature, and do any extreme values exist beyond the control limits? What do these observations indicate about pricing behavior, revenue variability, and profit stability in the sales dataset?
